Description

The **Pipe and Tank Sensor** is a wired temperature sensor, designed to detect the surface temperature of hot water flow pipes and water tanks in most common central heating applications.

This device, if integrated with the **temperature and humidity sensor (Cod. 01335-1855-00)** will send the detected temperature data to the latter and, depending on the logic defined by the user during the configuration of scenes and/or automations, will help manage the heating/cooling system in order to guarantee optimal control of the comfort temperature and energy consumed.
